HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Multimodal resources for lexical explanations during webconferencing-supported foreign language teaching: a LEarning and TEaching Corpus investigation.

1 Outline of the research question

Within the computer-assisted language learning (CALL) field, multimodal research endeavours to consider the simultaneous presence and interaction between verbal communication modes (audio, text chat) present in foreign language learning situations with co-verbal and non-verbal modes (gestures, gaze, posture, other kinesic aspects). This paper explores how trainee-teachers of French as a foreign language, during webconferencing-supported teaching, orchestrate different semiotic resources that are available to them for lexical explanations.

2 Study context and participants

The pedagogical context is a telecollaborative project where 12 trainee teachers of French as a foreign language met for online sessions in French with 18 undergraduate Business students from an Irish university. The participants met for seven 40-minute online sessions in autumn 2013 via the webconferencing platform Visu (Bétrancourt, et al., 2011). Each online session was thematic and focused on Business French.

A research protocol was designed around this learning context. Data produced during the learning project itself was collected (webcam videos, text chat messages, audio recordings of collective feedback session with the trainee teachers, reflective reports), as well as data produced uniquely for the research project (observation notes, post-course questionnaires and interviews). Participation in the research study was voluntary - all 12 trainee teachers (ten females, two males) and 12 students (eight females, four males) gave permission to use their data.

3 Staged methodology of the LEarning and TEaching Corpus approach

The data collected have been structured into a

4 Lexical explanations and multimodality

In the second part of the paper, the LETEC will be investigated to show how the trainee-teachers orchestrated different semiotic resources for lexical explanations. In face-to-face contexts, multimodality helps teachers explain the nuances of lexical items, reinforce verbal messages through illustration and reduce ambiguity (Kellerman, 1992; Lazaraton, 2004).

To study lexical explanations with regards to a weconferencing teaching context, a sub-set of the corpus will be used. It comprises primarily the webcam and hors-champ videos of three trainee teachers engaged in interactions (see Figure 3). Audio recordings of five trainee feedback sessions and extracts of trainee post-course interviews supplement the analysis.

The webcam interactions were transcribed (see Table 1) and annotated using the software ELAN (Sloetjes & Wittenburg 2008). Transcriptions of the feedback sessions were also completed. For the trainee post-course interviews, we proceeded by a global exploration phase of the audio recordings that allowed remarks and comments pertinent to our research question to be identified.

The paper will report quantitatively on the number of lexical explanations given in the weconferencing sessions examined and report on the different communication modes and modalities utilised. Then, in order to ‘zoom in’ on fine-grained detail, a qualitative analysis will examine several lexical explanation episodes to show how trainee teachers coordinated different communication modalities simultaneously to facilitate their lexical explanations.

Table 1: Multimodal transcription categories

An example of this fine-grained analysis is illustrated in Figure 3. The trainee-teacher combines audio and kinesics modalities to explain lexical item ‘volunteer’ (bénévole, in French): she combines the audio modality with a culturally specific emblem in the kinesics modality to illustrate ‘earning money’, then a self-deictic gesture to accompany the phrase ‘I’m a volunteer’ before using an abstract deictic gesture moving back and forth between the students’ and trainee teacher’s communication space to illustrate the difference in their situations. The corpus demonstrates how different multimodal resources are mobilized during lexical explanations. The trainee feedback session data and trainee interview data will complement the analysis by showing the importance that the trainee teachers attributed to the multimodal nature of the weconferencing environment.

5 Perspectives

To fully understand the contribution of multimodality to webconferencing-supported teaching, both the teacher’s and learners’ contributions to the interaction must be studied. This paper paves way for further analyses of the corpus that examine how the trainee teachers’ lexical explanations were received by the learners. The interest of organising data into LETEC in which the pedagogical design and research protocol are described is seen here: the corpus can be examined by researchers not originally involved in the pedagogical project for cumulative analyses.
